

ABSTRACT

An improved line guide for fishing rods includes a circular ring at one end. The perimeter of the circular ring has two opposite sides extended respectively downwards to form a vertical section. The vertical section has a distal end extended slightly outwards and downwards and bent inwards to become narrower to form an inclined conical section with a horizontal plane at one end. The two horizontal planes are symmetrical and joined juxtaposed to form a flat and conical fastening section. The circular ring further has a lower side extended downwards to form an arrow-shaped fastening section. The inclined conical section has a vertical surface to form surface contact with a fishing line. The inclined conical section can increase the strength of the line guide and prevent the line guide from deforming when subject to stress or impact from external forces.
